LUMSA and UNIDATA together for technology education

A new partnership establishes specific merit bursaries for the degree course

Rome, 12 October 2020 - To offer young students the opportunity to put their technological knowledge and skills into practise. This is the objective of the partnership between the LUMSA University in Rome and UNIDATA, established in the belief that for students of innovative technologies, the combination of university and business can present an extraordinary opportunity for cultural development and future vision.

The aim is to offer LUMSA students on the degree course in IT and data management the opportunity to evaluate and implement their knowledge in a company whose core business is innovation in the sector.

This new three-year degree course is geared to high-level professional training which can meet the demands of a sector - both within Italy and worldwide - with high standards of technical expertise and managerial skills.

The partnership translates into specific merit bursaries for the degree course; internships for students; seminars, conferences and other events geared to the illustration and diffusion of the culture of innovation and technology, for example in the fast-growing IoT sector.

For UNIDATA president Renato Brunetti, "Giving the students of this prestigious university the opportunity to acquire skills that can lead to greater professional openings means improving their chances for the future, and is a source of pride for UNIDATA, which sees on a daily basis the importance of excellent training in a fast-moving sector that's strategic for our country's economic growth".
